

1 Background

Health care systems have faced for decades: rising costs, rising demand, staff burnout, and significant variation in quality and patient experience. As individuals, as leaders and as members of organisations working in health care, how do we respond to these challenges so that we ensure our health care systems deliver high quality, sustainable health care into the future?

2 What?

We believe part of the answer relies on bringing together three well established concepts that frequently work in parallel rather than working together: Value-Based Health Care, Person-Centred Health Care and Health Equity. Bringing these concepts together results in high level focus areas: Shared Decision Making, linking values, goals and preferences to standardised data, involving people in the design and delivery of services, and allocating resources transparently. We have termed this concept **Person-Centred Value-Based Health Care**.

Person-Centred Value-Based Health Care (PCVBHC) Training Programme

About the Global Centre for PCVBHC

The vision of the Global Centre for PCVBHC - managed by Sprink - is that people are able to enjoy the outcomes that matter to them at that particular point in their lives. Health care systems discuss personal preferences, understand personal goals and link these to the data we capture, while simultaneously ensuring equity and the greatest quantum of health gain for the whole population. Health care systems are able to compare these metrics and the resources consumed within and between countries, to drive learning and value improvement. The Global Centre for PCVBHC has three areas of focus: research, education and implementation of PCVBHC. For more information please visit: <https://www.sprink.co.uk/global-centre-for-pcvbhc/>

3 Why?

PCVBHC is not new. All of the concepts promoted by PCVBHC are used today. However, they do not typically work together and they are not systematically applied across health care systems. By bringing these concepts together, PCVBHC will help address the challenges we face and it will help ensure that:

- The focus is on what matters to the individual.
- Measurement systems reflect what matters to our individual patients.
- Pathways and services are better orientated towards the values, goals and preferences of individuals.
- Limited resources are allocated and utilised according to people's values, goals and preferences.

4 How?

To support *your* role in responding to the health care challenges and to achieve a successful and systematic implementation of PCVBHC, the Global Centre for PCVBHC invites you to participate in the PCVBHC Training Programme.

This dynamic, innovative and ambitious training programme is delivered virtually, running over a three-month period. It brings together a world leading faculty combining pre-recorded lectures, live case study discussions, and group work focused on supporting you to develop a PCVBHC Implementation Project Plan for the organisation you work at.

We know that tackling these challenges and implementing PCVBHC will not happen overnight, but we hope that the knowledge and skills gained through this training programme will support individuals and organisations with the gradual process of bringing together Value-Based Health Care, Person-Centred Health Care and Health Equity.
